SUMMARIZED PROPOSAL

Newsite Estate Service Charge Management Platform

A practical digital system for apartment-linked payments, resident ledgers, reconciliation, expenses and estate financial accountability.

Prepared for	Newsite Estate Residents Association, FHA Newsite Estate, Lugbe, Abuja
Prepared by	Gazie Commute Technologies Ltd
Product	Gazie EstateOS
Core focus	Service charge payment, apartment ledger and financial reconciliation
Date	July 2026

Executive direction: Gazie EstateOS should not try to become a bloated estate app. The immediate win is to help Newsite Estate collect, identify, reconcile and report service charge payments with less stress and more transparency.

1. EXECUTIVE SUMMARY

Gazie EstateOS is proposed as a focused digital management platform for Newsite Estate. Its first priority is to solve the estate's service charge payment problem by connecting every payment to the correct apartment, resident ledger and management report. The platform will help estate officers reduce unidentified deposits, manual follow-up, spreadsheet errors and delays in confirming payments.

The system will also support expense tracking, vendor records and reconciliation so the estate can see both money received and money spent in one organized workflow.

2. PROBLEM TO SOLVE

- Residents currently pay service charges through different account names, company accounts or unclear bank narration, making identification difficult.
- Manual reconciliation takes time and creates room for missing records, duplicate entries and avoidable disputes.
- Residents need a simple way to see their own payment history, outstanding balance and current charges.
- Management needs a reliable view of estate income, expenses, vendors and outstanding apartments.
- Google Forms and manual reporting depend too much on resident compliance and administrative chasing.

3. PROPOSED SOLUTION

Gazie EstateOS will serve as the estate's payment and reconciliation layer. Each apartment will have a unique record, payment reference, ledger and balance status. Admins can confirm, match, flag and report payments from one dashboard.

4. SERVICE CHARGE PAYMENT FLOW

#	Stage	What happens
1	Apartment Setup	Every apartment is registered with owner/occupant details, service charge category and balance status.
2	Payment Reference	Each apartment receives a unique payment reference so bank transfers and platform payments can be matched correctly.
3	Resident Payment	Residents pay service charges and other fees using their phones or approved bank transfer instructions.
4	Auto/Assisted Reconciliation	Payments are automatically matched where possible. Unclear deposits are sent to an unidentified payments queue for admin review.
5	Ledger Update	The resident ledger updates with payment date, amount, purpose, balance and receipt status.

5. CORE FEATURES

Feature	Purpose
Resident mobile payment	Residents can pay service charges and approved estate fees from their phones, with every payment connected to an apartment record.
Apartment ledger	Each apartment gets a private ledger showing payment history, charges, outstanding balance and receipts.
Payment reconciliation dashboard	Admins can match bank inflows to apartments, detect unclear deposits, approve/reject entries and maintain clean records.
Unidentified payments queue	Deposits with unclear narration or unknown account names are flagged for review instead of being lost inside bank statements.
Expense management	Management can record estate expenses by category, date, approval status and supporting evidence.
Vendor tracking	Vendors can be registered with contact details, service type, payment history and outstanding obligations.
Reports and summaries	Management can generate summaries for paid apartments, debtors, expenses, collections and monthly financial status.

6. VALUE TO NEWSITE ESTATE

- Cleaner service charge records and fewer unidentified payments.
- Reduced workload for the financial secretary and estate executives.
- More transparency for residents because each apartment can see its own ledger.
- Better accountability around estate expenses and vendor payments.
- Faster monthly reporting and stronger trust between management and residents.

7. IMPLEMENTATION APPROACH

Phase	Focus	Outcome
Phase 1	Apartment and resident setup	Import apartment list, residents, service charge categories and existing balances.
Phase 2	Payment and ledger workflow	Activate payment references, resident ledger pages, receipt records and admin payment confirmation.
Phase 3	Reconciliation tools	Add bank statement upload/import, matching rules and unidentified payment review.
Phase 4	Expense and vendor module	Add expense categories, vendor records, approvals and monthly reporting.
Phase 5	Training and handover	Train admins and financial officers, document workflows and support initial usage.

8. RECOMMENDED NEXT STEPS

- Confirm the official apartment list, resident records and current outstanding balances.
- Agree the service charge categories, payment cycles and receipt format.
- Provide sample bank statements showing unclear payment entries for reconciliation testing.
- Approve the first pilot scope: payments, apartment ledger, reconciliation and basic reports.
- Run a controlled pilot with estate executives before opening access to all residents.

Important build principle: The existing platform should be protected. New features should be added carefully around the core payment and reconciliation workflow, not by rebuilding or breaking what already works.
