

SEED ROUND INVESTMENT PROPOSAL

Commute Service

A hyper-local, trust-based micro-mobility & rideshare infrastructure designed for gated estates and residential communities.

Prepared For:	Benedicta Nwaefido
Prepared By:	Michael Everest Nwaohiri Founder & Tech Lead, Commute Service
Date:	May 16, 2026
Location:	Lugbe, Abuja, Nigeria

1. Commute Service Overview

Commute Service is an innovative, hyper-local, trust-based rideshare platform engineered specifically to address the intensive daily commuting challenges within gated estates and structured residential communities. By connecting verified neighbors who have available empty car seats with fellow residents heading along identical workplace or school routes, the platform optimizes suburban transit through a systematic, estate-level trust framework.

Unlike conventional ride-hailing services that rely on a generic, commercial pool of unknown drivers, Commute Service utilizes localized resident networks and rigorous estate validation systems to deliver a highly reliable, cost-effective, and secure transportation alternative. The operational pilot is targeted for rollout within the Lugbe axis of Abuja, beginning with Newsite Estate and surrounding residential clusters.

2. Funding Objective & Equity Structure

SEED ROUND CAPITAL OBJECTIVE

₦5,000,000 Requested

Allocation: 5% Equity Stake | Implied Post-Money Valuation: ₦100,000,000

This capitalization will strictly fund the complete initial software development, core relational database infrastructure build, and launch operating runway over the next 6–9 months, advancing the platform seamlessly from concept stage into live community transaction generation.

3. Strategic Use of Funds

To maximize execution precision and avoid capital overlap, the ₦5,000,000 investment is budgeted cleanly into two core workflows over a 6 to 9-month timeframe:

Platform Development (40%)

₦2,000,000

Complete engineering of full-stack MVP architecture: relational data normalization (Supabase Pro), light mobile web application interfaces (Vercel Edge hosting), and real-time automated WhatsApp matching system notification webhooks.

Launch Operating Runway (60%)

₦3,000,000

Establishes a solid 6-7 month operating buffer: formal Corporate Affairs Commission (CAC) business incorporation, passenger liability waiver drafting, print estate signage, flyer kits, and localized Ambassador launch networks.

4. Valuation Justification (Why ₦100 Million Pre-Build?)

Securing a ₦100,000,000 valuation prior to product build is backed up by specific technical advantages, asset-light scaling physics, and immediate network entry locks:

1. High Technical Build Capital Efficiency

Building a secure, real-time marketplace app typically triggers massive third-party engineering agency costs. Because the core software architecture is designed and directly executed by an experienced, full-stack product engineer, the ₦2,000,000 development allocation produces enterprise-grade tech that would cost technical teams over ₦7,500,000 to construct externally. This efficiency protects investor capital from friction loss.

2. Structural Local Network Moat vs. Software Duplication

Software code can always be replicated; exclusive local estate entries cannot. The core value engine driving our valuation is the closed-loop trust infrastructure. Formal integrations with estate home-owner associations (HOAs) form a protective barrier. Generalized commercial ride-hailing networks like Uber or Bolt cannot easily audit or break into private, secure estate security systems.

3. Scalable Digital Marketplace Physics

As a digital matchmaker interface, Commute Service carries zero asset overhead—no vehicle purchase, fuel dependencies, or fleet maintenance fees. Once the baseline server code is compiled and live, the incremental cost of expanding to 10 more estates or adding 5,000 daily active riders is practically zero, triggering high operational profit margins.

4. Compounding Revenue Multiples & Network Density

While our initial Phase 1 baseline target (100 vehicles) outlines a conservative transaction fee capture for validation, the true model relies on rapid replications across Lugbe's massive residential hubs. Scaling to just 15 targeted estates expands ride liquidity exponentially, building powerful network density independent of supplemental subscription monetization tiers.

5. Post-Launch Phase 1 Projected Operating Budget

Once software compilation is finalized and live, the monthly recurring operational burn required to run and scale the pilot within the initial estate hubs is structured as follows:

Expense Category	Operational Coverage & Resource Allocation	Monthly Budget (₦)
Tech Infrastructure	Production servers, Supabase database, WhatsApp API text webhooks.	80,000
Ambassador Network	Stipends for local estate agents, on-site driver identity validation.	100,000

Operations & Admin	General management, communications data allocations, local logistics.	120,000
Marketing & Growth	Physical outdoor banners, estate flyering, local targeted acquisition.	50,000
Customer Success	Dedicated user support desks, issue triage pipelines, live matching assistance.	40,000
Legal & Compliance	Continuous estate compliance oversight, regulatory audits, filing reserves.	30,000
Total Monthly Operating Cost	Sustained Post-Build Operational Scaling Budget	420,000

6. Initial Revenue Architecture (100 Vehicle Scale)

The validation economics outline the baseline transaction fees captured upon introducing the initial core supply of active estate commuter vehicles:

- **Supply Pool:** 100 verified estate driver vehicles active on the platform.
- **Daily Volume:** Conservative target average of 2 matched paid seats per vehicle daily.
- **Temporal Scale:** Calculated over 22 active professional/corporate commuting days per month.
- **Unit Fee:** Set at a flat baseline platform processing micro-fee of ₦50 per individual matched seat.

$$\text{Monthly Gross Revenue} = 100 \text{ Vehicles} \times 2 \text{ Seats} \times 22 \text{ Operational Days} \times \text{₦50 Fee} = \text{₦220,000}$$

Estimated Baseline Gross Revenue Yield: ₦220,000 / Month

*Note: This basic fee capture model serves to validate early user loops. Scaling the completed technology to 15 targeted local estates drives transaction revenue to ₦4,400,000/month at 2,000 active vehicles, excluding layered recurring memberships.

7. Long-Term Monetization Blueprint

- **Premium Subscriptions:** Tiered monthly priority access passes for locked corporate transit routes.
- **Demographic Formations:** Specialized, strictly audited ladies-only commute clusters for maximized peace of mind.
- **Corporate Agreements:** B2B enterprise ride-pooling agreements mapping directly to urban commercial CBD zones.
- **Hyper-Local Placements:** Contextual programmatic ad placement reaching verified premium homeowners natively inside app alerts.

The foundational equity distributions, validation capital tranches, and operational configurations remain highly flexible and structural. Commute Service is actively targeting investment partners who provide strategic acceleration capability, institutional reach, and multi-market scaling expertise alongside financial injections.

Our immediate near-term operational mandate remains absolute structural proof-of-concept validation inside the Lugbe corridor, finalizing a repeatable blueprints network engineered for efficient deployment across the wider Federal Capital Territory.

I look forward to continuing our discussion and answering any operational, legal, or financial questions you might have.

Regards.
